# Decentraland - Building for Mobile

Here's a quick guide on how to detect Mobile in your scene code, preview and play your scene in Mobile directly from Creator Hub and the best practices to create quality UIs for Mobile.

## 📱 Mobile Clients

Decentraland Mobile is available both in Play Store (Android) and Testflight (iOS).

GET IT ON Google Play

Available on TestFlight

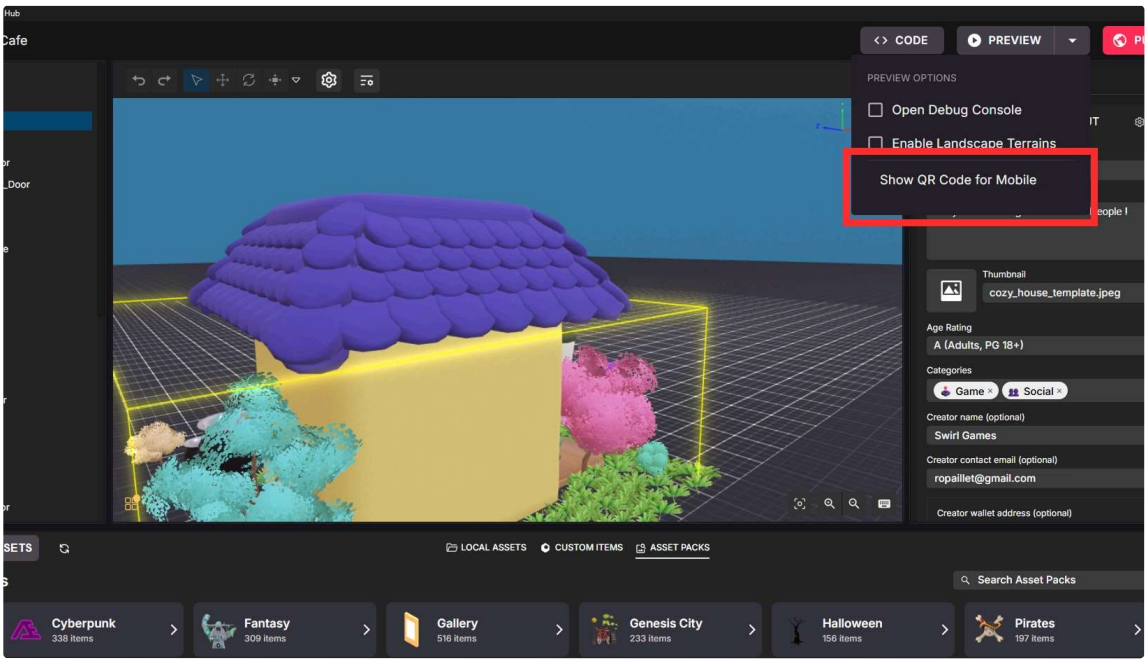
# 🖼️ Mobile Preview Mode (Creator Hub)

You can preview your scene directly in the Mobile Client from the Creator Hub or via Command Line. Test how your scene works, debug gameplay and adjust scene UI to suit the mobile client.

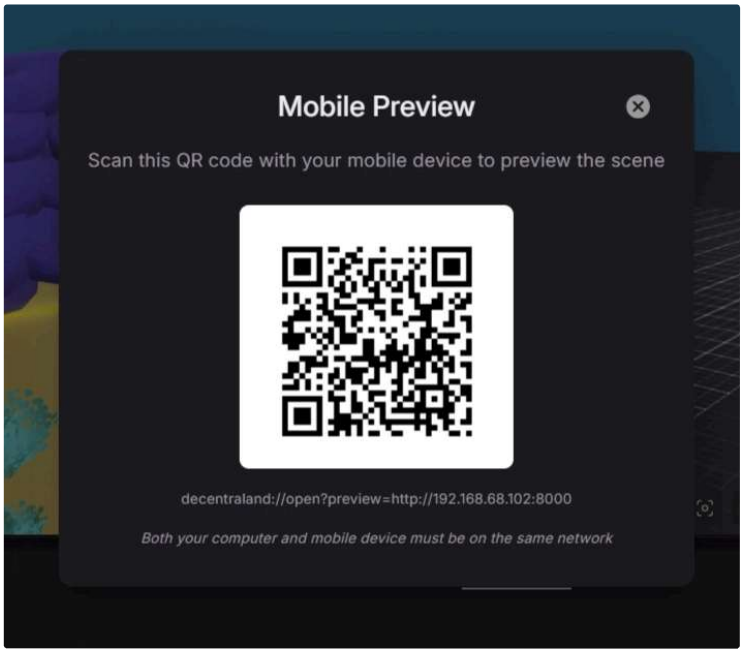
> ⚠️ The computer running Creator Hub and your mobile device must be on the same WIFI.

## A) Via Creator HUB

- Go to Preview > “Show QR Code for Mobile”



- Scan the QR Code



## B) Via Command Line

1. Open Terminal and run `npm run start -- --mobile`
2. Scan the QR Code Generated in the Command Line

# 👩‍💻 Checking if Mobile Client via Code

Detecting mobile allows you to adapt UI/UX and gameplay logic dynamically. This is useful to create custom mechanics, UI or handle inputs differently for mobile users and deliver mobile-first experiences that delight users.

## Available Functions

- `getPlatform()` - Returns `'mobile' | 'desktop' | 'vr' | 'web' | null`
- `isMobile()` - Returns true if mobile client
- `isDesktop()` - Returns true if desktop client

## 1) Import Functions

```
typescript import { getPlatform, isMobile, isDesktop, isWeb } fro
m '@dcl/sdk/platform'
```

## 2) Define UI based on Client

```
function setupUI() { if (isMobile()) { // Larger buttons, simpler
layout for touch createMobileUI() } else if (isDesktop()) { // Mo
re detailed UI with hover states createDesktopUI() } }
```

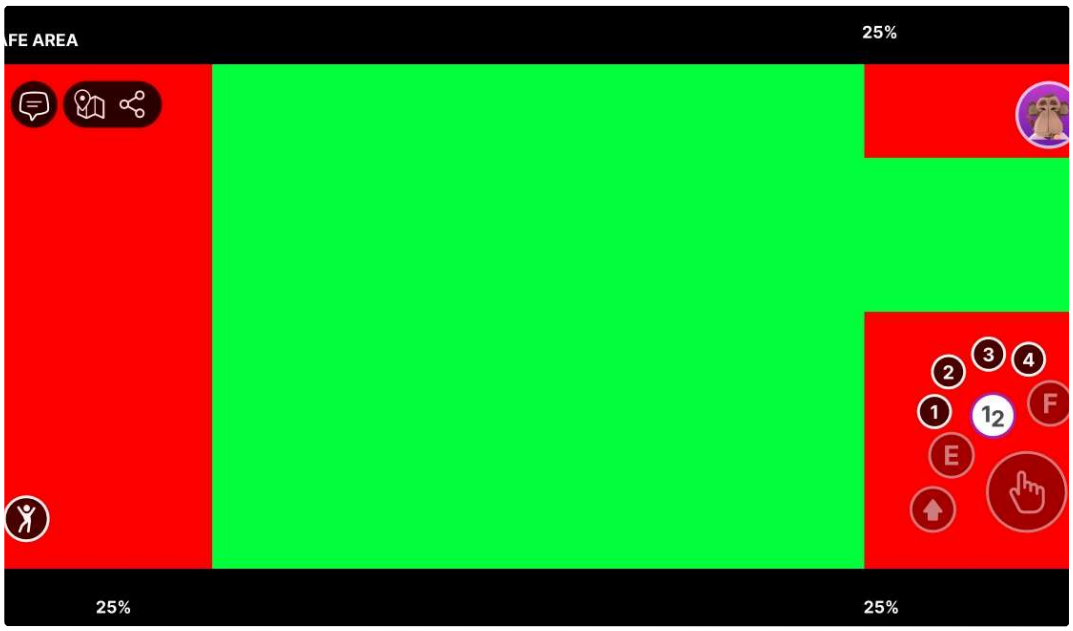
# 🏞️ Mobile Scene UIs

Making sure your scene UI displays correctly in Mobile is **key to delight players and get featured in the Discover** section. Here's a quick guide on how to design great UIs for mobile.

## ☐ Mobile Safe Area

The **mobile safe area** is a guideline to follow when placing UI elements. When creating scene UIs, **do not put any element inside the red area**, so they do not clash with client controls.

- **Left**: Reserved for Chat, Search, Profile, Joystick, Emotes.
- **Top right**: Reserved for Profile access and camera controllers.
- **Bottom right**: Reserved for the interaction button(s)



## ✏️ Creating Scene UIs for Mobile

There is not a single "proven" way to design UIs for Decentraland Mobile yet. We are still experimenting and iterating.

### ✅ DOs

- Design mobile specific UIs or set UI elements by screen size
- Ensure critical UI is **inside the safe area**
- Minimize available options, progressively disclose elements as needed
- Put all actionable dialogues at center of screen (0.)
- Put all messages that don't require actions on top-center of screen

### ❌ DONT's

- Set UI Size by pixel size, output will change depending on screen size.
- Put elements outside the safe area, as they will conflict with controls.
- Use small buttons or rely on hover states.
- Avoid key actions on keybinds 1-4, as they are not easily available in Mobile

### Recomendations

- Follow the **Safe Area**.
- Design and test the UI on **Desktop** first.
- Then scale up UI sizes by **3×** for Mobile to improve readability.

### Limitations

- `border-radius` is not supported on Mobile yet.

## ⭐ Mobile Featuring

The Mobile **Discover section receives the highest traffic** and is the best way to showcase your scene to mobile players.
